Variable Reluctance Speed Sensor E58S

INDUSTRIAL SPEED SENSORS

Product ID

	Type #		Product #		Drawing #				
	E58S		385Z-05227	•	113.298				
General									
Function	The E58S series variable reluctance (VR) speed sensors consist of an iron core an inductive coil, and a permanent magnet. A ferrous pole wheel passing the sensor face changes the magnetic field strength, resulting in an AC voltage being induced in the coil. The frequency of the output signal is proportional to the speed of the moving target. The amplitude of the signal depends on speed, air gap, geometry of target, magnetic properties of target material, and the electrica load. VR sensors, also known as passive or electromagnetic sensors, do not require an external supply.								
Technical data									
Coil properties	 Inductance @ 1 kHz: 170 mH ± 10% Resistance: 850 Ohm ± 10% Magnet polarity: north pole towards front face Pole piece: diameter 2.7 mm 								
Polarity	Upon approach of ferrous metal, the signal pin is positive with respect to GND.								
	affected by	amplitude shov y air gap, target ed of the teeth. Typical of		material. It	is also prop				
	Peak Peak amplitude (****		M = 0.5 M = 1.0 M = 2.0 M = 4.0			
	0.10	0.5 1	1.5 2 Air gap	2.5 (mm)	3 3	.5 4			
Frequency range	Up to 20 kHz, lower limit depending on application								
Housing	5/8"-18 UNF-2A, tightening torque: max. 35 Nm								
Connection	Cable with open leads: 3-wire, 3 x 0.34 mm2 (AWG22), stranded wires, elastomer isolation, green casing, fire retardant, low smoke, RoHS conform and halogen free, max. outer Ø = 4.8 mm, min. bending radius = 25 mm (static) and 50 mm (dynamic), cable length according to dimensional drawing								
Protection	Sensor head: IP68 Cable outlet: IP67								
Insulation	Housing and electronics galvanically isolated (Test: 500 V, 50 Hz for 1 minute)								
Pole wheel	 Prerequisite: Toothed wheel of a ferrous material (e.g. Steel 1.0036). Optimal performance with Involute gear Tooth width > 10 mm 								

IN CHARGE OF SPEED

OPERATING INSTRUCTIONS E58S REV. 0

	 Side offset < 0.2 mm Eccentricity < 0.2 mm 				
Air gap between sensor and pole wheel	Depending on lowest circumferential speed which has to be detected and on trigger level. See figure.				
Electromagnetic compatibility (EMC)	Please contact Jaquet for further details.				
Vibration & shock immunity	Jaquet Greenline sensors are approved for rough environments. Please contact Jaquet for further details.				
Operating temperature	-40°C125°C				
Further Information					
Safety	All mechanical installations must be carried out by an expert. General safety requirements have to be met.				
Installation	The sensor has to be aligned to the pole wheel according to the sensor drawing independent of its rotational orientation. Deviations in positioning may affect the performance and decrease the noise immunity of the sensor. During installation, the smallest possible pole wheel to sensor gap should be set. The gap should however be set to prevent the face of the sensor ever touching the pole wheel. A sensor should be mounted with the middle of the face side over the middle of the pole wheel. Dependent upon the wheel width, a certain degree of axial movement is permissible. However, the middle of the sensor must be at minimum in a distance of 3 mm from the edge of the pole wheel under all operating conditions. A solid and vibration free mounting of the sensor is important. Eventual sensor vibration relative to the pole wheel can induce additional output pulses. The sensors are insensitive to oil, grease etc. and can be installed in arduous conditions.				
Maintenance	Product cannot be repaired.				
Transport	Product must be handled with care to prevent damage of the front face.				
Storage	Product must be stored in dry conditions. The storage temperature corresponds to the operation temperature.				
Disposal	Product must be disposed of properly, it must not be disposed as domestic waste.
